

Question 4

4.1)

This view is based on a single base table (Sales_Order) with a simple condition.

Therefore, it is updatable.

4.2)

UPDATE 1

The view is based on a join between Product and Sales_Order_Details.

The column Selling_Price belongs only to the Product table, so it is updatable.

UPDATE 2

The update based on product table and Sales_Order_Details table...so it is not updatable.

4.3)

This is a simple view on one table (Product).

Update is successful ,So Changes directly reflect in Product table.

4.4)

This view is based on two tables.

Insert operation does not include all required columns ,So DBMS cannot determine which table to insert into.

SQL does not allow inserting into multiple base tables via a view.

4.5)

Updating or inserting data into multiple tables through a view is not allowed.

But it works when only one table is affected.

4.6)

This is a simple view on one table.

Delete operation directly affects the base table.

Record is deleted from Client table.

4.7)

Without CHECK OPTION the update is allowed even if it breaks the condition.

But with CHECK OPTION it is blocked if the condition is not satisfied.
